ELGIN

Shale shakers are the backbone for solids control systems. Company's in oil & gas, trenchless, microtunnelling, geothermal, foundation, construction, and water well industries utilize shakers to manage waste solids, to recover drilling fluid or water, increase productivity and reduced disposal costs. In all cases, the quality of the screen dictates the overall performance of the shaker.

Elgin's screens are API compliant and tested by third-party agencies to meet the stringent requirements of API 13C RP.

BlueCrest™ composite screens provide improved quality, performance, storage life, delamination resistance and handling.

By focusing on each customer's unique problems, Elgin® has become more than an original equipment manufacturer, we have become a trusted solutions provider. With locations and distributors worldwide, we are proud to offer durable value, now. Our pride is truly expressed in our work through our craftsmanship, research, design and the overall practicality of our products.

Let Elgin® be your complete turn-key solutions provider for liquid/solid separation, dewatering and waste management operations.

BlueCrest™ composite screens optimize solids control efficiency to reduce costs and waste volumes, regardless of the targeted formations and drilling applications.

Composite screens provide for higher tension of woven wire cloth. As such, they provide for an improved cut point and extended wear life.

Nitrile perimeter gasket provides hydrocarbon resistance and mitigates solids bypass.

Performance – Elgin's BlueCrest™ composite screens provide higher surface tension. The heating process causes the wire mesh to contract and provide for a tighter surface tension. The higher the surface tension, the longer lasting the screen. This means that higher flow rates with more viscous drilling fluids can be managed.

Quality – BlueCrest™ composite screens inherently have a higher quality control. There is no chance for discontinuities and/or variations in the quality. There is no chance for human error in the welding, powder-coating, and/or grinding process. This ensures consistent quality with each screen used.

Resists Premature Delamination – Metal framed screens are made from components that are laminated together by powder-coat paint. This bond is based on the consistency of the powder-coat, how well the metal frame was cleaned, and how well the heat press temperatures were controlled. Composite screens are not laminated. As such, there is no ability for the perforated plate or the wire mesh to prematurely separate from the frame.

Composite Polyurethane Technology – Traditional screens are constructed using a rigid steel frame and perforated plate; in which layers of woven wire cloth are bonded with powder-coating. New manufacturing technology has advanced shaker screen construction using composite material with steel reinforcement. These changes increase strength, longevity, and performance.

Storage Life – The storage life of a metal framed screen presents a number of complications. Shipping of the screens, or mishandling of them, can cause the screens to warp. The base metal, despite the application of powdercoat, can result in corrosion. This is not the case when managing composite screens. Composite screens frames do not dent or warp from mishandling. They also have no exposed metal, so there is no means for frame corrosion.

Improved Handling – BlueCrest™ composite screens have less sharp edges that can cut operators when handled. Molded products provide for a cleaner edge and minimize the number of sharp burrs and edges.
